

Winsorized bond-related article counts around Texas bond events

Average monthly count per city-event; city-month counts capped at the 99th percentile (9 articles)

Notes: Winsorization is applied to unique city-month observations before constructing event windows. The sample is restricted to issuers with at least one election having a positive number of RavenPack sources in the prior 12 months. Each bond proposition is a separate election observation. The figure reports raw averages of the winsorized counts without confidence intervals.
